Preview and review cloud infrastructure plans

Validate source scope, inspect provider evidence, and follow the approved implementation path.

https://docs.qintoravacloud.com/guides/cloud-plan/

Build the plan

Select an approved connection and scope in **Cloud management & FinOps**. Choose the resource type and enter the required existing resource IDs. Review generated parameters and templates. Check region, network and ownership against discovered inventory before asking a reviewer to act.

Verify validation

Evidence	Meaning
Local policy checks	Confirm supported inputs and scope.
AWS CloudFormation template validation	Checks syntax and declared capabilities. Verify resource IDs, permissions and quota independently.
Azure request accepted	Check terminal validation status before considering the plan validated.
Google Cloud preview unavailable	Check the environment policy and the allowed implementation path.

Review the plan and linked change, then obtain the required independent approval. Record the plan version and verified provider outcome. The approval documents the plan and workflow. Confirm execution through the approved implementation mechanism and its provider receipts.
